Effective: 11/12/15

Revised/Reviewed: 2/11/16, 2/9/17, 2/8/18, 2/14/19

VCHCP POLICY ON SCREENING FOR AUTISM

**Purpose:**

To ensure that all children obtain autism screenings at ages 18 months and 24 months. It has been found that children diagnosed with Autism Spectrum Disorder (ASD) have improved long-term prognoses when early intervention has been received. Early identification also allows etiologic investigation and counseling regarding recurrence risk.

**Scope:**

Family Practitioners and Pediatricians caring for children age 2 and younger. The prevalence of ASD is approximately 6 to 7 per 100 in the United States. Therefore, PCPs are likely to diagnosis and provide care for children with ASDs.

**Policy:**

All VCHCP contracted providers are to adhere to the American Academy of Pediatrics (AAP) and Center for Disease Control (CDC) guidelines regarding screening for autism spectrum disorder. This includes:

1. Surveillance at every well-child visit. Recognize the early subtle red flags that indicate the possibility of an ASD.
2. Administration of a standardized development tool such as the Modified Checklist for Autism in Toddlers (M-CHAT) questionnaire or Pervasive Developmental Disorders Screening Test-II, Primary Care Screener (PDDST-II PCS) at age 18 and 24 months as well as a surveillance of risk factors. Risk factors include a sibling with ASD, parental concern, other caregiver concern or pediatrician/FP concern. Results are to be recorded in the medical chart of the patient.
3. If the ASD-specific screening result is negative but the parents and/or the PCP remains concerned, the PCP should schedule a follow up visit.
4. If the ASD-specific screening result is positive or if a child demonstrates 2 or more risk factors, refer for an appropriate comprehensive ASD evaluation

For VCHCP members, the comprehensive evaluation is done through the Tri-Counties Regional Center Program (TCRC). Children at ages up to 45 days prior to the 3<sup>rd</sup> birthday will be referred for an Early Start Developmental Assessment. Children over 3 years old will be referred to a case manager. The initial evaluation does not require a prior authorization and is free of charge. PCPs or parents can call directly to TCRC for an appointment at (800) 664-3177.

For members diagnosed with ASD, early intervention is key. Applied Behavioral Analysis (ABA) services are covered by VCHCP through our contracted providers.

*Note: Reimbursement for developmental delay screening can be obtained by using CPT code 96110.*

## Administrative Policy: Screening for Autism

Created: 10/09/15

Effective: 11/12/15

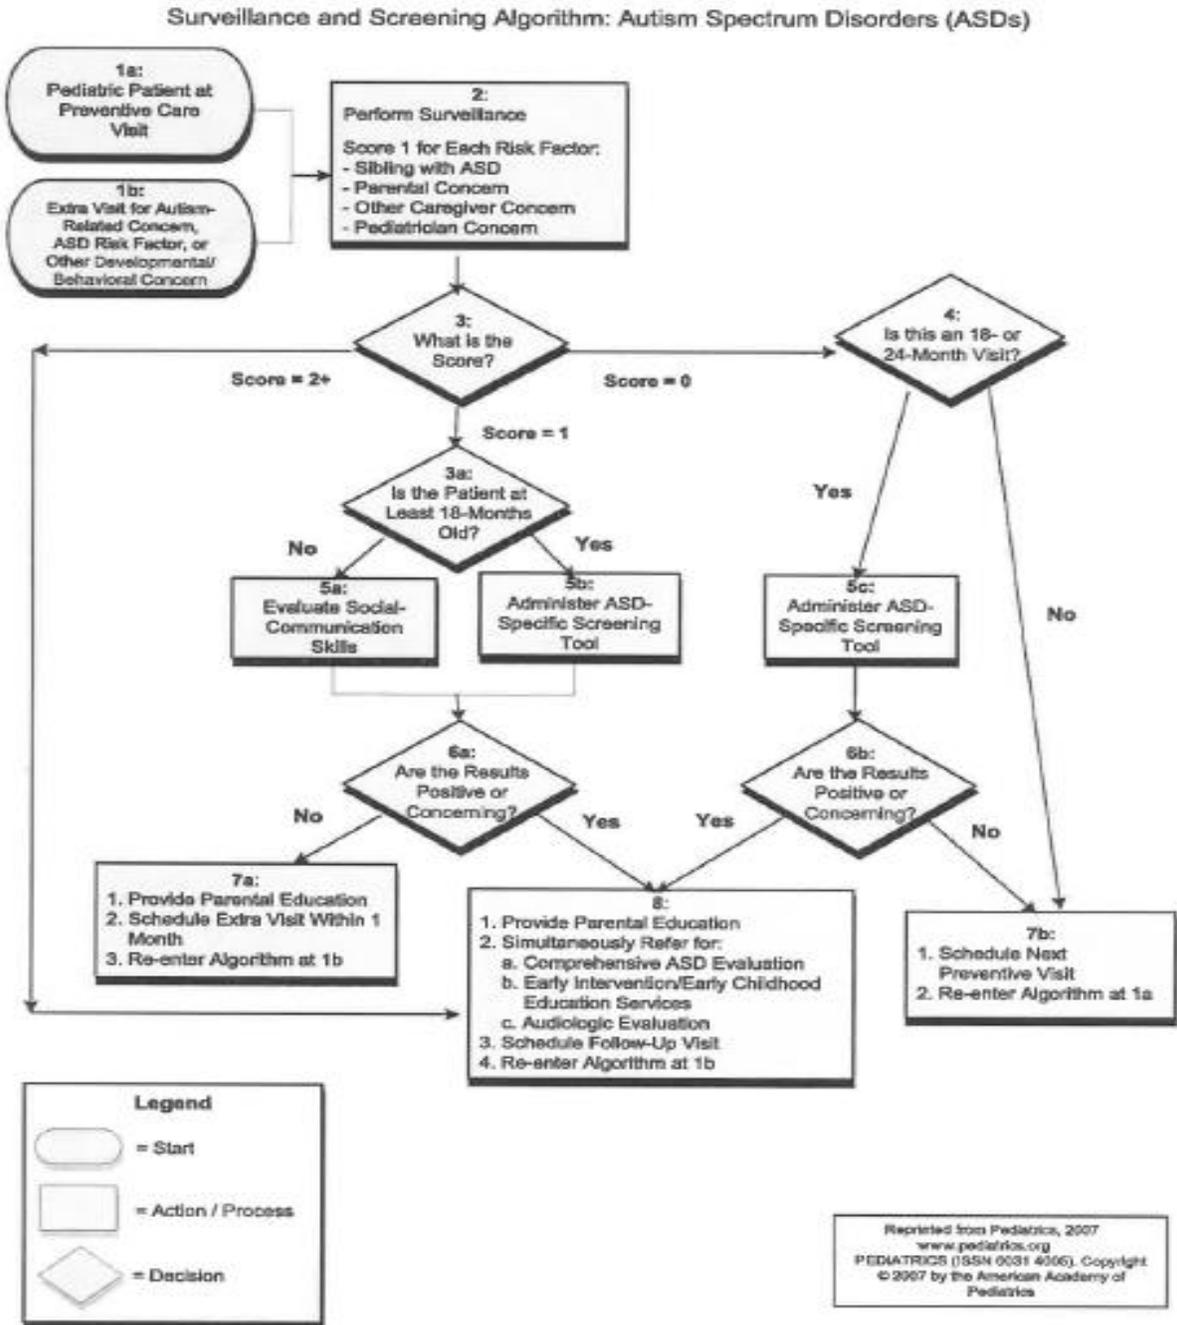

Revised/Reviewed: 2/11/16, 2/9/17, 2/8/18, 2/14/19

### **Evaluation of Compliance:**

In order to ensure that the above policy is followed and that all children are appropriately screened for ASD, VCHCP will include in each provider's medical record audit the capture of data related to screening(s) done, screening results and follow up. Any provider who is not compliant with this activity may receive additional educational information regarding the screening procedure, follow up limited audit and possible corrective action plan (CAP) if warranted. If a CAP is requested, a Quality Assurance team member will monitor activities until the CAP details are addressed satisfactorily.

**A. Attachments:**

**I. Surveillance and Screening Algorithm: Autism Spectrum Disorders**

II. M-CHAT instructions for use, M-CHAT questionnaire and scoring guide

**Instructions and Permissions for Use of the M-CHAT**

The Modified Checklist for Autism in Toddlers (M-CHAT; Robins, Fein, & Barton, 1999) is available for free download for clinical, research, and educational purposes. There are two authorized websites: the M-CHAT and supplemental materials can be downloaded from [www.firstsigns.org](http://www.firstsigns.org) or from Dr. Robins' website, at <http://www2.gsu.edu/~wwwpsy/faculty/robins.htm>

Users should be aware that the M-CHAT continues to be studied, and may be revised in the future. Any revisions will be posted to the two websites noted above.

Furthermore, the M-CHAT is a copyrighted instrument, and use of the M-CHAT must follow these guidelines:

- (1) Reprints/reproductions of the M-CHAT must include the copyright at the bottom (© 1999 Robins, Fein, & Barton). No modifications can be made to items or instructions without permission from the authors.
- (2) The M-CHAT must be used in its entirety. There is no evidence that using a subset of items will be valid.
- (3) Parties interested in reproducing the M-CHAT in print (e.g., a book or journal article) or electronically (e.g., as part of digital medical records or software packages) must contact Diana Robins to request permission ([drobins@gsu.edu](mailto:drobins@gsu.edu)).

**Instructions for Use**

The M-CHAT is validated for screening toddlers between 16 and 30 months of age, to assess risk for autism spectrum disorders (ASD). The M-CHAT can be administered and scored as part of a well-child check-up, and also can be used by specialists or other professionals to assess risk for ASD. The primary goal of the M-CHAT was to maximize sensitivity, meaning to detect as many cases of ASD as possible. Therefore, there is a high false positive rate, meaning that not all children who score at risk for ASD will be diagnosed with ASD. To address this, we have developed a structured follow-up interview for use in conjunction with the M-CHAT; it is available at the two websites listed above. Users should be aware that even with the follow-up questions, a significant number of the children who fail the M-CHAT will not be diagnosed with an ASD; however, these children are at risk for other developmental disorders or delays, and therefore, evaluation is warranted for any child who fails the screening.

The M-CHAT can be scored in less than two minutes. Scoring instructions can be downloaded from <http://www2.gsu.edu/~wwwpsy/faculty/robins.htm> or [www.firstsigns.org](http://www.firstsigns.org). We also have developed a scoring template, which is available on these websites; when printed on an overhead transparency and laid over the completed M-CHAT, it facilitates scoring. Please note that minor differences in printers may cause your scoring template not to line up exactly with the printed M-CHAT.

Children who fail more than 3 items total or 2 critical items (particularly if these scores remain elevated after the follow-up interview) should be referred for diagnostic evaluation by a specialist trained to evaluate ASD in very young children. In addition, children for whom there are physician, parent, or other professional's concerns about ASD should be referred for evaluation, given that it is unlikely for any screening instrument to have 100% sensitivity.

**M-CHAT**

Please fill out the following about how your child usually is. Please try to answer every question. If the behavior is rare (e.g., you've seen it once or twice), please answer as if the child does not do it.

- |  |     |    |
|--|-----|----|
| 1. Does your child enjoy being swung, bounced on your knee, etc.?  | Yes | No |
| 2. Does your child take an interest in other children?   | Yes | No |
| 3. Does your child like climbing on things, such as up stairs?   | Yes | No |
| 4. Does your child enjoy playing peek-a-boo/hide-and-seek?   | Yes | No |
| 5. Does your child ever pretend, for example, to talk on the phone or take care of a doll or pretend other things?       | Yes | No |
| 6. Does your child ever use his/her index finger to point, to ask for something?   | Yes | No |
| 7. Does your child ever use his/her index finger to point, to indicate interest in something?                            | Yes | No |
| 8. Can your child play properly with small toys (e.g. cars or blocks) without just mouthing, fiddling, or dropping them? | Yes | No |
| 9. Does your child ever bring objects over to you (parent) to show you something?  | Yes | No |
| 10. Does your child look you in the eye for more than a second or two?   | Yes | No |
| 11. Does your child ever seem oversensitive to noise? (e.g., plugging ears)  | Yes | No |
| 12. Does your child smile in response to your face or your smile?  | Yes | No |
| 13. Does your child imitate you? (e.g., you make a face-will your child imitate it?)                                     | Yes | No |
| 14. Does your child respond to his/her name when you call?   | Yes | No |
| 15. If you point at a toy across the room, does your child look at it?   | Yes | No |
| 16. Does your child walk?  | Yes | No |
| 17. Does your child look at things you are looking at?   | Yes | No |
| 18. Does your child make unusual finger movements near his/her face?   | Yes | No |
| 19. Does your child try to attract your attention to his/her own activity?   | Yes | No |
| 20. Have you ever wondered if your child is deaf?  | Yes | No |
| 21. Does your child understand what people say?  | Yes | No |
| 22. Does your child sometimes stare at nothing or wander with no purpose?  | Yes | No |
| 23. Does your child look at your face to check your reaction when faced with something unfamiliar?                       | Yes | No |

## Modified Checklist for Autism in Toddlers (M-CHAT)\*

**PLEASE NOTE: The M-CHAT was not designed to be scored by the person taking it. In the validation sample, the authors of the M-CHAT scored all checklists. If parents are concerned, they should contact their child's physician .**

---

### Abstract

*Autism, a severe disorder of development, is difficult to detect in very young children. However, children who receive early intervention have improved long-term prognoses. The Modified – Checklist for Autism in Toddlers (M-CHAT), consisting of 23 yes/no items, was used to screen 1076 children. Thirty of 44 children given a diagnostic/developmental evaluation were diagnosed with a disorder on the autism spectrum. Nine items pertaining to social relatedness and communication were found to have the best discriminability between children diagnosed with and without autism/PDD. Cutoff scores were created for the best items and the total checklist. Results indicate that the M-CHAT is a promising instrument for the early detection of autism.*

### Background

The M-CHAT is an expanded American version of the original CHAT from the U.K. The M-CHAT has 23 questions using the original nine from the CHAT as its basis. Its goal is to improve the sensitivity of the CHAT and position it better for an American audience.

The M-CHAT has been steadily expanding its radius of usage in the state of Connecticut and surrounding New England states. Its authors are still collecting data on the initial study, awaiting final outcomes for sensitivity and specificity after the subjects return for their 3.5 year well-child visit by 2003. The authors have applied for funding of an expanded study on 33,000 children. The M-CHAT tests for autism spectrum disorders against normally developing children.

### M-CHAT Scoring Instructions

A child fails the checklist when 2 or more critical items are failed OR when any three items are failed. Yes/no answers convert to pass/fail responses. Below are listed the failed responses for each item on the M-CHAT. Bold capitalized items are CRITICAL items.

Not all children who fail the checklist will meet criteria for a diagnosis on the autism spectrum. However, children who fail the checklist should be evaluated in more depth by the physician or referred for a developmental evaluation with a specialist.
